# Commercial Vegetables for Fresh Market and Processing

## USUAL PLANTING AND HARVESTING DATES

### In Principal Producing Areas

#### INTRODUCTION

This publication of the Crop Reporting Board provides information on usual planting and harvesting dates for fresh and processing vegetables. Twenty-seven principal fresh market vegetables and melons, 10 principal processing vegetables, mint for oil, and strawberries are included in this publication. Data are shown only for the crops and States included in our regular program of estimates. Hawaii, with a continuous growing season, is not divided into seasonal groups and is not included in this publication.

The same seasonal classifications are listed for the fresh market crops in each State as in the regular program of vegetable reports. Classifications are determined by the season, or period within the season, when the bulk of each crop is usually harvested. These seasonal groupings are as follows:

#### SEASONAL GROUPS AND SUB-GROUPS USED FOR FRESH MARKET VEGETABLE, MELON AND STRAWBERRY CROPS

(Dates refer to period of most active harvest)

##### Classifications Most Commonly Used

Winter:	January, February, March	Early Summer:	July 1-August 15
Spring:	April, May, June	Late Summer:	August 16-September 30
Early Spring:	April 1-May 15	Fall:	October, November, December
Late Spring:	May 16-June 30	Early Fall:	October 1-November 15
Summer:	July, August, September	Late Fall:	November 16-December 31

##### Classifications Used for Certain Short Season Crops

Early Spring:	April	Early Summer:	July
Mid-Spring:	May	Mid-Summer:	August
Late Spring:	June	Late Summer:	September

The beginning and ending of these seasons are not fixed, as indicated by the above dates; rather, they are approximations. There is some overlapping in the marketing seasons for individual crops. Also, weather and economic factors frequently disturb normal harvest schedules. Consequently, the classifications employed are generally less precise than the dates indicate. Data for each of the 10 principal processing crops follow the fresh market segment of the commodity. Except for asparagus and spinach, estimates for processing vegetables are not available by seasonal groups.

Harvesting dates for most vegetables refer to the period when the crop is removed from the field. For crops which are left in the field to cure, harvesting dates refer to the time the crop is pulled, cut, or picked. Dates are not necessarily those of marketing or processing. For perishable crops, harvesting and marketing or processing periods are nearly identical, but for storage crops, such as cabbage and onions, the marketing season extends beyond the end of harvest. In areas where production for processing is from acreage grown primarily for fresh market, harvesting for processing usually follows the harvest for fresh market.

Planting dates refer to the period during which seeding or transplanting is usually done. It is recognized that fields may, at times, be planted before or after the normal period indicated. Dates shown do not take into account abnormal planting seasons caused by climatic or economic factors. The principal producing counties are grouped by geographic areas within States. County names are listed in alphabetical order without reference to their importance.

The material in this bulletin supersedes data formerly published in Agriculture Handbook 80, "Commercial Vegetables for Fresh Market, Usual Planting Dates, Usual Harvesting Dates, Principal Producing Areas," and Agriculture Handbook 85, "Vegetables for Commercial Processing, Usual Planting and Harvesting Dates and Principal Producing Counties by States."
